

## SnapGuard™

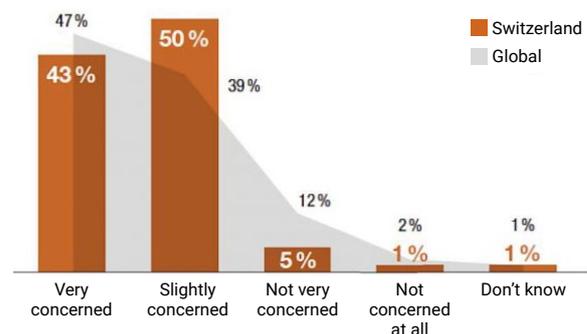

### More than 90% of Swiss and 85% of global CEOs are concerned about cyber threats.

As a recent PwC survey of 5,050 CEOs from 100 countries shows, the topic is currently very present in the minds of senior management. In many cases, cyberthreats have been underestimated, and it is only as a result of the numerous incidents in the media that the topic has increasingly been coming up on the radar of executive committees.

Business changes in the pandemic and the ever more complicated IT world have done their bit to raise awareness at a management level. These changes include the trend toward working from home, accelerated cloud migration and digitization.

The recently disclosed vulnerabilities in Exchange Server have made the issue even more explosive. As Microsoft reports, criminals would use ransomware after an initial compromise of unpatched local Exchange servers, which often culminate in demands for high ransoms. The number of attempted attacks on enterprises has been shown to double every two to three hours. The direct and indirect damage caused by the temporary shutdown of IT is immense for affected companies.

How concerned are you about cyber threats?
